Honey Bees: *Apis Mellifera*

There are over 20,000 known species of bee in the world, from bumblebees to leafcutter bees to mason bees. But beekeeping involves keeping hives full of the Honey Bee, or *Apis Mellifera* to give it its Latin name.

The Honey Bee lives in colonies of 00000000 depending on the time of the year, with number increasing from mid-March / early April until mid-summer, after which the numbers decline for the arrival of autumn and winter.

A honey bee hive is made up mostly of female worker bees. In addition, all healthy colonies have one queen (who lays the eggs for new bees to hatch) and in the summer, the bees hatch male drone bees whose primary - and apparently sole - purpose is mating and reproduction.

Importance

Making Honey

honey frame

SWARMS

- Why
- How it happens
- Stopping your colonies from swarming
- Catching swarms

VIDEO AND PHOTOS OF A SWARM

Beekeeping: the basics

Life as a beekeeper

> what you need to get started:

- suit and veil
- hive tool
- smoker
- brush
- hive boxes
- costs of a colonies
 - how much time you need to devote to it
 - photos
 - getting stung

Honey

What is honey?

> Uses: food, medicine

When do you take it

How do you harvest it
How much do you take / leave for the bees
How much can you expect per hive

Extraction process 1: preparing the hives

Extraction process 2: preparing the frames

Using the honey extractor
